Faculty of International Resource Sciences

The Faculty of International Resource Sciences is the only faculty in Japan where students can study of natural resources with such a strong science and technology approach. The faculty's programs combine earth science and geotechnology with a focus on economic-minerals, petroleum exploration, development, and production. The Faculty also provides studies in the humanities with a focus on the politics and cultures of resource-producing nations. Students will learn from professors who are world-class researchers in their respective fields about natural resources and their importance in our daily life. Graduates will be able to apply their practical and theoretical knowledge at the international level, strengthening the ties between the faculty and other universities, companies, and research institutions both in Japan and abroad.

Faculty Organization Department of International Resource Sciences

Looking toward resolving various issues connected to natural resources on a global scale, with an emphasis on practical abilities and maintaining an international perspective.

Resource Policy and Management

Students study resource-producing regions' cultures and learn how to communicate with people from diverse cultural backgrounds and different value systems. They deepen their knowledge of economics, policy, and law relating to resource development.

Earth Resource Science

This field of study is focused on the dynamics of earth history. Students study and research the formation and distribution-systems of the earth's underground resources (such as economic-minerals and petroleum) throughout the 4.6 billion years of the earth's history.

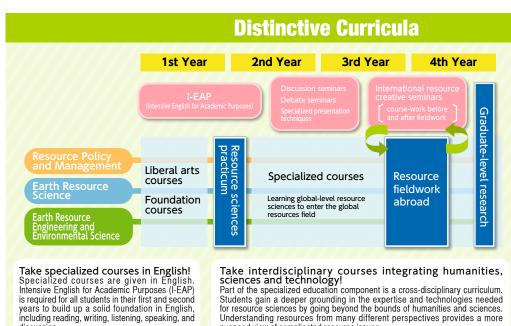

Earth Resource Engineering and Environmental Science

Students are given a comprehensive overview of resource development and the global environment, from resource exploration, development, and production methods, to refining and recycling technologies and environmental conservation.

nuanced view of complicated resource issues.

In their third year, students gain exposure to applied resource sciences via resource fieldwork abroad, such as internships with mining companies or surveys with research institutions in resource-producing countries. The direct experience of seeing with one's own eyes what happens at resource sites around the world gives students a real taste of resource sciences in giving them a direct understanding

Learn while abroad!

of the issues and problems faced, and leading them towards their graduate-level research.
