< 解答例 >

Japan’s doctor shortage problem is bad, and will only worsen. Something must be done. I have several ideas. First, the government should create more medical schools. There should be at least two in every prefecture, with at least one public program. Iwate, my home prefecture, doesn’t have a public medical school, so many young people of Iwate go elsewhere to study medicine. Second, existing medical colleges could be expanded and better funded, to allow them to admit more students. Finally, special scholarships and loans for people to study medicine in other countries, if they promise to return to Japan to work as doctors, could be offered. The doctor shortage is a serious problem, but there are many possible solutions. (119 words)
